

Flowing with Pressure: Liyab ng Kabataan

The Gerona Youth Fire Olympics 2026, known as “Liyab ng Kabataan,” is an event that promotes teamwork, discipline, readiness, and awareness of fire safety among young people. In addition to developing these important values, the event can also be associated with physics concepts, particularly Bernoulli’s Principle.

Bernoulli’s Principle explains that when the speed of a moving fluid increases, its pressure decreases. This concept can be seen in the way water moves through fire hoses and nozzles. As water passes through a smaller opening, its velocity increases, helping the water travel farther and reach its intended target.

This scientific principle is relevant to firefighting activities because hoses and nozzles are used to control the flow, speed, and direction of water. Understanding how moving fluids behave can help explain how water is effectively delivered during firefighting.

Overall, the Gerona Youth Fire Olympics can be linked to Bernoulli’s Principle by demonstrating how physics is applied in real-world activities. Aside from encouraging teamwork and emergency preparedness, the event also shows how scientific knowledge can be useful in practical situations.
